

DKMV

An agent control plane that turns GitHub Issues into autonomous coding-agent runs — assign a workflow and an agent, press Run, and watch the work happen. *Assign it and walk away.*

☒ Indigo theme · Dark

High-fidelity interactive prototype

asaficontact/DKMV

01 Connect & project picker onboarding

03 Issue detail & launch conversion

05 Human-in-the-loop checkpoint control

07 Workflow / component builder authoring

02 Board — issues by agent state home

04 Live run — watch the agent observability

06 Runs history & analytics spend

First-run onboarding — connect GitHub, then pick one repository to work in.

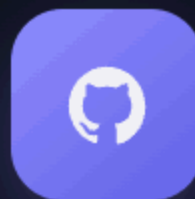

Welcome

Syncing

Indigo ▾

Turn your GitHub issues into work that runs itself.

Connect a repo, assign each issue a workflow and an agent, and press Run. DKMV opens a sandbox, does the work, and brings back a pull request — while you watch.

Connect GitHub

✓ Read-only on your code. We only read issues and add agent:* labels. Nothing runs until you say so.

The home base. GitHub issues as cards in columns, with an at-a-glance spend & status strip.

This run needs your decision to continue

I found 4 candidate phases for this implementation. How would you like to proceed?

Mapped the multi-agent adapter into 4 implementation phases: (1) AgentAdapter protocol, (2) Claude adapter, (3) Codex adapter, (4) model→agent inference + event normalization.

☒ **Proceed with all 4 phases** recommended

Implement the full plan as analyzed (recommended).

☐ **Merge phases 3 & 4**

Combine the last two phases to ship a smaller first cut.

☐ **Let me edit the plan first**

Pause here so I can adjust scope before continuing.

Aggregate stats, spend over time, a retry queue, and a sortable, filterable runs table.
